

Figure 1. Lightweight FHIR Bulk-to-OMOP Software Demonstration Workflow

Imported OMOP Clinical Tables

person: 27 records
visit_occurrence: 1,386 records
condition_occurrence: 983 records
drug_exposure: 1,275 records
observation: 14,168 records
measurement: 14,150 records

Vocabulary Mapping Completeness

condition_occurrence: 100.00% mapped
drug_exposure: 78.12% mapped
measurement: 99.99% mapped
observation: 99.99% mapped
visit_occurrence: 0.00% mapped

The demonstration uses fully synthetic FHIR Bulk NDJSON data, imports it into a local SQLite OMOP CDM database using pyOMOP, applies OHDSI Athena vocabulary mappings, and generates basic standard concept analytics for interactive software demonstration.
